SDS LinkedIn Post Series — April 2026

Account: Scientific Data Systems (SDS)

Why These Posts Are Built This Way

The 2026 LinkedIn algorithm rewards **saves** (5× more powerful than likes), **carousel/image posts** (6.6% engagement vs. 0.42× reach for text-only on company pages), and **relevance over reach**. Company page organic content now represents only 1–2% of the feed — so every post has to earn its spot.

Each post below is **1,300–1,600 characters** (the engagement sweet spot), opens with a hook that lands inside the 210-character preview window, uses single-line paragraph breaks for mobile readability, and ends with a conversation-starting question to drive comments. **3–5 hashtags max** (more than 5 triggers a 68% reach penalty).

Image direction uses the SDS brand palette: **Slate Base (#182939)**, **Signal Blue (#3498DB)**, **Dark Text (#1A2A3A)**, **White (#FFFFFF)**, **Gold Accent (#C6A92B)**.

POST 1 — Problem Awareness

Post type: Single image **Publish:** Tuesday or Wednesday, 7:00–8:30 AM CT

Post Copy

Your crew is running two panels because that's what they were trained on.

Not because it's better. Not because it's safer. Because nobody questioned it.

Two panels means double the cables. Double the connections. Double the failure points between your crew and a clean job.

And when something goes sideways at 2 AM, nobody's asking about your panel philosophy. They're asking why the data didn't come back clean.

Warrior runs logging and perforating from a single surface unit. One panel. One interface. Same job — half the complexity.

That's not a sales pitch. That's 33 years of watching crews deal with problems that shouldn't exist.

The wireline industry accepted the two-panel setup a long time ago. We just never agreed it was the only way.

What's the one piece of equipment on your truck you'd eliminate tomorrow if you could?

#Wireline #WellServices #Perforating #DataAcquisition #Warrior

Image Direction

Format: Single static image, 1200×628 px (LinkedIn recommended) **Visual:** Dark slate (#182939) background. Clean side-by-side comparison layout. Left side: tangled cable illustration with the label "Industry Standard" — multiple panel outlines, cable runs, connection points. Right side: single clean panel outline with the label "Warrior" — one cable path, one connection point. Minimal linework in white (#FFFFFF) with Signal Blue (#3498DB) accent on the Warrior side. No photography. Industrial technical-drawing aesthetic. **Text on image:** Top line in white, caps: `SAME JOB. HALF THE COMPLEXITY.` Bottom-right corner: SDS logo + "sdsdata.com" in small white type. Gold accent (#C6A92B) thin rule separating the two sides. **Tone:** Schematic, clean, high-contrast. Feels like a field engineer's whiteboard sketch — not a marketing department's Canva template.

POST 2 — Credibility / Social Proof

Post type: Carousel (PDF upload, 4 slides) **Publish:** Tuesday or Thursday, 7:00–8:30 AM CT

Post Copy

The question we hear most from operations managers isn't about price.

It's this: "Will it work with the tools we already have?"

Here's the honest answer.

Warrior is universally compatible with 60% of open-hole tools, 85% of cased-hole tools, and 90% of addressable switches across manufacturers. Logging and perforating. One surface system.

That means your crews don't choose between their preferred tools and their acquisition system. They use both.

No forced hardware purchases. No ecosystem restrictions. No switching costs.

In an industry where most platforms lock you into one manufacturer's ecosystem, we took the opposite position — and we've held it for 33 years.

Universal compatibility isn't a feature we added. It's the reason the company exists.

If you could use any combination of tools and switches on your next job without worrying about compatibility — what would your ideal loadout look like?

#Wireline #OpenPlatform #DataAcquisition #CasedHole #Warrior

Carousel Slides (4 slides, 1080×1080 px each)

Slide 1 (Cover/Hook): Dark slate background. Large white text: `"Will it work with the tools we already have?"` Smaller text below in Signal Blue: `The question every ops manager asks first.` SDS logo bottom-right, gold accent line across bottom edge.

Slide 2 (The Numbers): Dark background. Three large stat callouts stacked vertically, each with a gold accent number and white descriptor:

- **60%** of open-hole tools
- **85%** of cased-hole tools
- **90%** of addressable switches

Small white text at bottom: `One surface system. Logging and perforating.`

Slide 3 (What This Means): Slate background. Three short lines in white, left-aligned, with Signal Blue check marks:

- No forced hardware purchases
- No ecosystem restrictions
- No switching costs

Header in white caps: `YOUR EQUIPMENT. YOUR CHOICE.`

Slide 4 (Close): Dark background. Centered white text: `Universal compatibility isn't a feature we added.` Second line in gold: `It's the reason the company exists.` SDS logo centered below. `sdsdata.com` in small white type at bottom.

Tone: Data-forward, clean, high-contrast. Each slide should be readable in under 3 seconds. No stock photography. Typography-driven. The carousel should feel like a spec sheet that respects your time, not a pitch deck.

POST 3 — Outcome / Vision

Post type: Single image **Publish:** Wednesday or Thursday, 7:00–8:30 AM CT

Post Copy

The best field service managers we know share one thing in common.

They're not the ones glued to their phone at midnight. They're the ones whose crews don't need to call.

That doesn't happen by accident. It happens when the system on the truck is consistent — same interface, same workflow, same data standards — no matter who's running the unit.

Warrior was designed around that idea. Purpose-built interfaces that show each crew member exactly what their job requires. Nothing more. Nothing less.

The field hand isn't wading through engineering menus. The engineer isn't guessing what the shooter sees. Everyone works from the same operational picture.

When your crew runs a clean job because the system made the right call obvious — that's not software. That's operational certainty.

And that's the shift from managing problems to preventing them.

What would change in your operation if every truck ran the same consistent workflow?

#Wireline #FieldOperations #DataAcquisition #WellServices #Warrior

Image Direction

Format: Single static image, 1200×628 px **Visual:** Dark slate background. A single bold quote in large white type, centered: `"The best shift is the one nobody had to call you about."` Below the quote in smaller Signal Blue type: `— Built for Field Service Managers` Gold thin rule above and below the quote block. SDS logo bottom-right. `sdsdata.com` in small white. **Tone:**Editorial. Quiet confidence. Feels like something you'd see framed in a well-run district office, not on a social media feed. The restraint IS the brand.

POST 4 — Ease of Access (Lead Post)

Post type: Carousel (PDF upload, 5 slides) **Publish:** Tuesday or Wednesday, 7:00–8:30 AM CT

Post Copy

Most wireline acquisition systems make you earn the right to use them.

Earn it with your wallet. Earn it with weeks of training. Earn it by abandoning the tools your crews already trust.

We've never understood that model.

Warrior was built around a different idea: the easiest system to say yes to.

Your existing tools? Plug-and-perf ready out of the box. Compatible with 60% of open-hole tools, 85% of cased-hole tools, and 90% of addressable switches — no retrofitting, no forced hardware swaps.

Your crews? Purpose-built interfaces designed around the job, not the software. Field hands tell us their people are running clean jobs within hours of first contact with the system. Not weeks. Hours.

Your budget? $46–65K for the full panel. $500–$1,000 annual maintenance. That's enterprise-grade capability at a price point that doesn't require a board meeting.

We publish those numbers because the industry doesn't — and you shouldn't have to sit through a demo to find out what something costs.

Easy to integrate. Easy to learn. Easy to afford. That's not a tagline. That's the whole point.

What's the biggest barrier you've faced when evaluating a new acquisition system?

#Wireline #DataAcquisition #Warrior #WellServices #PlugAndPerf

Carousel Slides (5 slides, 1080×1080 px each)

Slide 1 (Cover/Hook): Dark slate (#182939) background. Large white text, two lines: `WHAT IF THE HARDEST PART / OF SWITCHING SYSTEMS… WASN'T?` Gold accent (#C6A92B) thin rule beneath. SDS logo bottom-right in white.

Slide 2 (Your Tools): Dark background. Header in white caps: `YOUR TOOLS. NO COMPROMISES.` Below, three stat lines with Signal Blue (#3498DB) numbers and white descriptors, stacked vertically:

- **60%** of open-hole tools supported
- **85%** of cased-hole tools supported
- **90%** of addressable switches supported

Small white text at bottom: `Plug-and-perf ready. Out of the box.`

Slide 3 (Your Crew): Slate background. Header in white caps: `HOURS TO LEARN. NOT WEEKS.` Below in white body text, left-aligned: `Purpose-built interfaces show each crew member exactly what their job requires — nothing more.` Second line: `The system fits the workflow. Your people don't have to change how they work.` Gold rule at bottom edge.

Slide 4 (Your Budget): Dark background. This is the slide people will screenshot. Large gold numbers centered: `$46–65K`with white subtext `Full panel — logging and perforating` Below: `$500–$1,000/yr` with white subtext `Annual maintenance` Small white text at bottom: `We publish our pricing because you shouldn't need a demo to know what something costs.`

Slide 5 (Close): Dark slate background. Three lines centered in white, stacked: `Easy to integrate. Easy to learn. Easy to afford.` Below, in gold: `That's the whole point.` SDS logo centered. `sdsdata.com` in small white at bottom.

Tone: The most direct carousel in the series. Slide 4 is intentionally designed to be screenshotted and shared — pricing transparency in this industry is almost unheard of, and that rarity is what makes it saveable. The visual language stays schematic and restrained. No photography. Let the numbers and the clarity do the work.

Implementation Notes

- **Post from the company page**, but also have key SDS personnel (founder, sales leads, field engineers) **reshare with personal commentary** — personal profiles get 561% more reach than company pages in 2026.
- **Carousel posts (Post 2) are the highest-performing format** on company pages at 6.6% engagement. Prioritize these. Text-only posts on company pages are essentially invisible.
- **Saves are the #1 algorithm signal.** Posts 2 and 4 are designed to be saved and screenshotted — compatibility stats and transparent pricing are rare reference material in this industry. Post 4's pricing slide is the most likely piece in the series to be shared outside LinkedIn.
- **Respond to every comment within 60 minutes** of posting. Early engagement velocity determines whether LinkedIn expands distribution.
- **Post 4 should run first or second in the series.** Lead with ease of access — it's the broadest message and the lowest barrier to engagement. The pricing transparency will stop scrollers who've never heard of SDS.
- **3–4 posts per week** is the sustainable cadence. Quality over volume — always.
